TASK 2 – DAY 3 STUDENT GUIDE

Focus: Test your system, record evidence, and continue improving your solution

Your Goal Today

By the end of today, you should have:

- A **working or partially working system**
- A **completed test plan (with multiple entries)**
- Clear links between:
  - your **test plan**
  - your **testing.md file**
  - your **video evidence**
- Evidence that you have:
  - tested
  - identified issues
  - attempted improvements

Important Mindset

Your system does NOT need to be perfect today.

You will gain marks for:

- showing what works
- showing what does NOT work
- showing how you improve it over time

THE TASK 2 LOOP (Use this all lesson)

For each feature:

1. Build or improve it
2. Test it
3. Record it in your test plan

4. Link your video evidence
5. Update testing.md
6. Fix or improve (if possible)
7. Retest later

🟢 STEP 1 – Quick System Check (30–45 mins)

Test your main features:

- Create
- Read
- Update
- Delete

👉 If something is broken:

- attempt a fix

OR

- continue and record it in testing

🟢 STEP 2 – Complete Your TEST PLAN (Main Task)

You must now begin filling in your **test plan table**.

📘 *For EACH test, include:*

- Test ID
- Feature being tested
- Type of test data:
  - normal
  - erroneous
  - boundary
  - wrong
  - absent
- Expected result
- Actual result

- Fix required? (Yes/No)

🎥 *Link Your Video Evidence*

Each test MUST link to:

- a video saved in your `/testing-videos` folder

Example:

Test 11 – Validation (see video: Test 11 – Validation Testing)

📝 *Link to testing.md*

Your testing.md must match your test plan:

- same test
- same result
- short explanation

☑️ *Minimum Expectation Today*

You should complete at least:

👉 **3–5 high-quality tests**

NOT lots of weak tests.

🟢 STEP 3 – When Things Do Not Work

If a test fails:

You MUST:

1. Record it in your test plan

- mark as **fail**

- explain what happened

2. Add to testing.md

- describe the issue clearly

Then choose:

- Attempt a fix now

OR

- Leave it and fix later

🧠 Important

A failed test with a clear explanation is still strong evidence.

🟢 STEP 4 – Improve Your System (Development Time)

You should still be developing your system today.

Core improvements (everyone should attempt):

- Fix broken CRUD features
- Improve validation
- Improve error messages
- Improve layout or usability

If you finish early:

- Add small improvements (not new large features)
- Make your system more reliable

STEP 5 – Fix + Retest (Iterative Development)

If you fix something:

You MUST:

In versioning.md:

- what was broken
- how you fixed it
- which test found it

In your test plan:

- update the result

OR

- add a retest entry

Record a short confirmation video

Regression Check

After fixing:

- check another feature still works

STEP 6 – Using AI and the Internet (Allowed)

You are allowed to use:

- AI tools
- websites (e.g. tutorials)

Use support for:

- debugging
- understanding code
- improving your system

You MUST record:

- what you used
- what it helped with
- what you changed

Example:

"I used AI to debug my Delete function. It helped identify an incorrect ID reference. I updated the code to match my database structure."

STEP 7 – Writing Framework (Bullet Points Only)

Add short notes:

- what you tested
- what worked
- what failed
- what you improved
- what you will improve next

EXTENSION (Higher Band Students)

If your system is working well, you should aim for:

Stronger Testing

- Use ALL test types:
  - normal, erroneous, boundary, wrong, absent

- Create more detailed test plan entries
- Perform regression testing

Better Development

- Improve validation logic
- Improve user feedback messages
- Improve data accuracy and consistency

Code Quality

- remove repeated code
- use reusable functions
- improve naming and structure

Evidence Quality

- clearer test explanations
- better links between:
  - test plan
  - testing.md
  - video evidence

SUPPORT FOR STUDENTS WHO ARE STUCK

If you are struggling:

👉 Focus ONLY on:

- getting Create + Read working
- completing 3 clear tests
- recording results properly

This is enough to move forward.

END OF DAY CHECKLIST

You must have:

- A **partially or fully working system**
- A **test plan with 3–5 completed tests**
- Matching entries in `testing.md`
- Linked video evidence
- Updates in `versioning.md`
- Notes in your writing framework
- Any AI or external help recorded

Final Reminder

You are building evidence across multiple days.

Today is about:

- testing
- recording
- improving

Not finishing everything.
