

Task 2 – Student Rubric and Guidance (Total: 44 Marks)

Your complete guide to understanding what to do, how to do it and how to reach the highest marks.

Before You Start – Setup Checklist

Tick each one when you are ready.

- You have a GitHub account
- You created a new repository for your project
- You enabled **GitHub Pages** to host your site
- You created a **Supabase** project
- Your Supabase table is set up correctly (see template below)
- You copied the **public anon API keys** (never the secret key)
- You created `index.html`, `styles.css` and `app.js`
- You added your Supabase URL + API key into `app.js`
- Your site loads successfully from GitHub Pages

How Your Project Works (Simple Visual Guide)

HTML Form → JavaScript → Supabase Database → JavaScript → Website Display → GitHub Pages Hosting

This is the “flow” the marker will look for.

Section 1: Functionality (16 marks)

Does your website work properly? Does it use JavaScript + Supabase + CRUD?

Band	Marks	What This Means	What You Need to Show
Band 1	1–4	Your project has started but is not fully working.	• Website loads but is mostly static. • JS does not work properly. • No link to Supabase. • CRUD missing. • GitHub Pages may be broken.
Band 2	5–8	Some features work but CRUD is incomplete.	• JavaScript talks to Supabase a little. • One or two CRUD actions work (e.g. Add works, Edit does not). • Errors appear often. • Hosted version partly works.
Band 3	9–12	Most things work. CRUD is nearly complete.	• Website works locally and mostly online. • CRUD mostly working. • Supabase table set up with correct columns. • Only minor issues remain.
Band 4	13–16	Everything works smoothly and correctly.	• Full CRUD: Create, Read, Update, Delete all work. • Works perfectly on GitHub Pages. • No major bugs. • Supabase table designed and created correctly with suitable column types and matches design. • Website behaves like a real application.

Section 2: Code Organisation (8 marks)

Is your code tidy, easy to read and professionally structured?

Band	Marks	What This Means	What You Need to Show
Band 1	1–2	Code is messy or hard to follow.	• Few/no comments. • Poor structure. • Almost no commits. • README.md missing.
Band 2	3–4	Basic organisation shown.	• HTML, CSS and JS in separate files. • Some commits. • Some comments. • Basic README.md.
Band 3	5–6	Good organisation and clear structure.	• Folder structure (css/, js/, img/). • Good comments. • Useful commit history. • README.md explains project.
Band 4	7–8	Excellent organisation – like a real developer.	• Clean, tidy code. • Modular JavaScript functions. • Many meaningful commits. • Professional README.md. • No secret keys anywhere.

Section 3: User Experience (8 marks)

Is your site clear, accessible and easy for a user to understand?

Band	Marks	What This Means	What You Need to Show
Band 1	1–2	Website is difficult to use.	• Confusing layout. • Very little styling. • No clear messages.
Band 2	3–4	Basic design and usability.	• Some CSS styling. • Basic layout. • Simple feedback messages. • Some CSS, JS and images load correctly on the GitHub Pages version.
Band 3	5–6	Good design and helpful feedback.	• Clear layout. • Good use of colour/spacing. • Helpful error & success messages. • Layout adapts well on desktop and either tablet or mobile screens. • Most CSS, JS and images load correctly on the GitHub Pages version.
Band 4	7–8	Excellent design and fully accessible.	• Labels on all inputs. • Alt text for images. • Clear buttons. • Good contrast. • Works perfectly when hosted. • Layout adapts well on desktop, tablet and mobile screens. • All CSS, JS and images load correctly on the GitHub Pages version.

Section 4: Testing (6 marks)

Does your testing clearly show what you tried and fixed?

Band	Marks	What This Means	What You Need to Show
Band 1	1–2	Only basic tests.	• Normal data only.
Band 2	3–4	Good range of tests.	• Normal, invalid, blank and extreme data. • Some fixes shown.
Band 3	5–6	Full testing including hosted site.	• Normal, invalid, blank and extreme data. • GitHub Pages version tested. • Bugs recorded. • Fixes and re-tests shown clearly. • Error-handling tested (JavaScript validation + SQL constraints).

Section 5: Security, Legal and Standards (6 marks)

Is your work safe, accessible and responsible?

Band	Marks	What This Means	What You Need to Show
Band 1	1–2	Some awareness.	• Labels used. • Basic validation.
Band 2	3–4	Mostly good safety and standards.	• Accessibility features used. • Inputs validated. • Some GDPR awareness.

Band 3	5–6	Very strong safety and accessibility.	• Only Supabase public key used. • No secret keys in GitHub. • Clear privacy awareness. • Very accessible design.
---------------	-----	---------------------------------------	---

Supabase Table Template

Students often get this wrong. Be careful! You can use the following as inspiration!

Column names in Supabase must exactly match your JavaScript code or CRUD will fail. This closes a major gap that causes 70% of student Supabase errors.

Table Name: tbl_reminders

Column	Type	Notes
id	int8	Primary key, auto increment
reminder_type	text	Not null
due_date	date	Not null
notes	text	Optional

Testing Log Template

Test No.	Input	Expected Output	Actual Output	Fix Made?	Re-Test Result
1	reminder_type = ""	Show error	App crashed	Added validation	Passed

Common Mistakes to Avoid

- Using the wrong Supabase key (never use the secret key)
- Typing column names incorrectly
- Forgetting to publish GitHub Pages
- Storing all code in one file
- Writing commit messages like “update”

- Not checking the browser console
- Only testing with perfect data
- Forgetting the README.md
- Using spaces in file names
- Not re-testing after fixing a bug

If You Get Stuck (Follow in this order)

1. Check the **browser console** for errors
2. Check your Supabase URL and anon key
3. Check table column names
4. Use `console.log()` to see what's happening
5. Re-publish GitHub Pages
6. Look at your commit history to find a working version
7. Google error messages or check documentation
8. Ask for help if you have tried everything

Final Submission Checklist

You must tick **all** of these before submitting:

Website & Hosting

- GitHub Pages site works
- CRUD fully working

- All JavaScript errors removed
- Correct Supabase URL and anon key

Code Quality

- Files separated into HTML, CSS and JS
- Code tidy and commented
- Meaningful commit messages
- README.md includes purpose, features, setup steps and live link.
- Strong commit history showing progress over time.

Design

- Buttons and forms labelled
- Accessible colours and fonts
- Accessibility planned (labels, alt text, colour contrast, keyboard access).
- Helpful messages for errors and success

Testing

- Normal data
- Invalid data
- Blank data
- Extreme values
- GitHub Pages tested
- Fixes recorded and re-tested

Safety

- Only public Supabase key used
- No unused keys, debug printouts or database credentials left in code.
- No private keys in GitHub
- GDPR / privacy considered
